Preparing Raspberry Pi

Install Raspbian Jessie on the Raspberry Pi

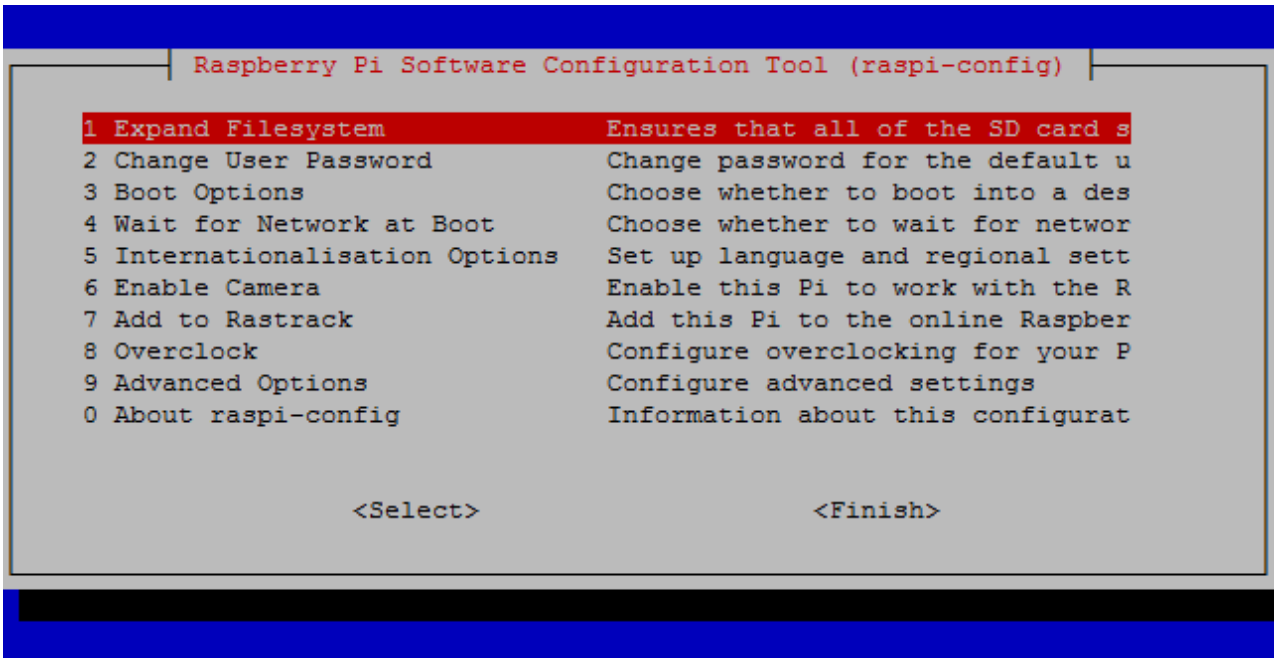
Click **HERE** to download Raspbian Jessie.

Expand file system

Run the following command line within the Raspberry Pi's terminal.

```
sudo raspi-config
```

You should see a blue screen with options in a gray box in the center, like so



Choose "Expand Filesystem"

Choosing this option will expand your installation to fill the rest of the SD card, giving you more space to use for files. **You will need to reboot the Raspberry Pi to make this available.**

Raspberry Pi sample code

Revised 2/15/17

Update and Upgrade Packages

First, you will need to update your system's package list by entering the following command in terminal.

```
sudo apt-get update
```

Next, upgrade your installed packages to their latest versions with the command.

```
sudo apt-get upgrade
```

Running the upgrade may take up to 30 minuets depending on which version of the Raspberry Pi you have.

Download the sample code

To download the Atlas Scientific™ sample code,run the following commands within the Raspberry Pi's terminal.

```
cd ~
```

```
git clone https://github.com/AtlasScientific/Raspberry-Pi-sample-code.git
```

Once the sample code has finished downloading, you will be almost ready to begin using the Atlas Scientific™ EZO™ class circuits with your updated Raspberry Pi.

There are three different ways to interact with the Atlas Scientific™ EZO™ class circuits with your Raspberry Pi.

- **USB Mode**
- **I²C Mode**
- **UART Mode**

Raspberry Pi sample code

Revised 2/15/17

Sample code compatibility chart

	Pi 2	Pi 3	Pi Zero
USB (FTDI)			
I2C			
UART			

The Raspberry Pi Foundation has failed to make a working UART on the Pi 3. Because of this no UART connected devices can run on a Raspberry Pi 3.

USB Mode

USB Mode

USB mode will let you communicant through the Raspberry Pi's USB port to any FTDI based USB device. This includes all USB based Atlas Scientific™ devices.

First, we need to install the libftdi package.

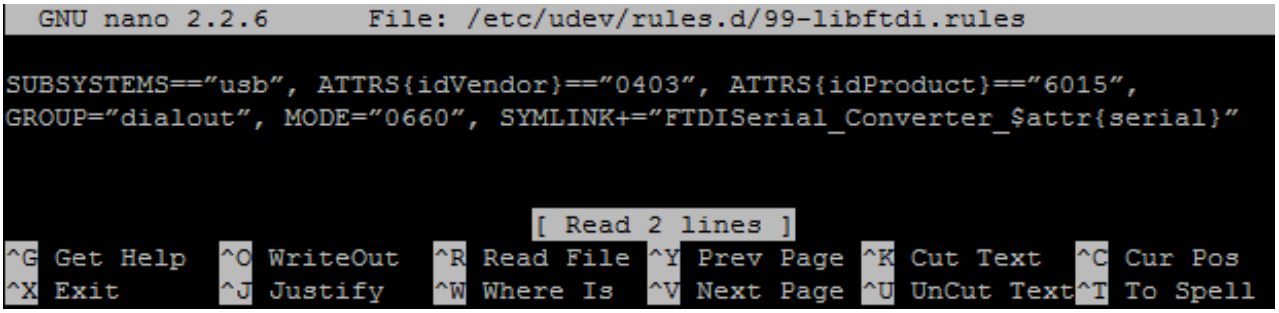
```
sudo apt-get install libftdi-dev
```

Next, we need to install the pylibftdi python package.

```
sudo pip install pylibftdi
```

We need to create a udev rule file by entering the following command in terminal.

```
sudo nano /etc/udev/rules.d/99-libftdi.rules
```



Replace the current rule with following revised rule below.

```
SUBSYSTEMS=="usb", ATTRS{idVendor}=="0403", ATTRS{idProduct}=="6015",
GROUP="dialout", MODE="0660", SYMLINK+="FTDISerial_Converter_$attr{serial}"
```

Press "CTRL+X", then "Y" and hit Enter to save & exit.

Once the updated udev rule has been saved, a restart is required in order to apply changes to the rule.

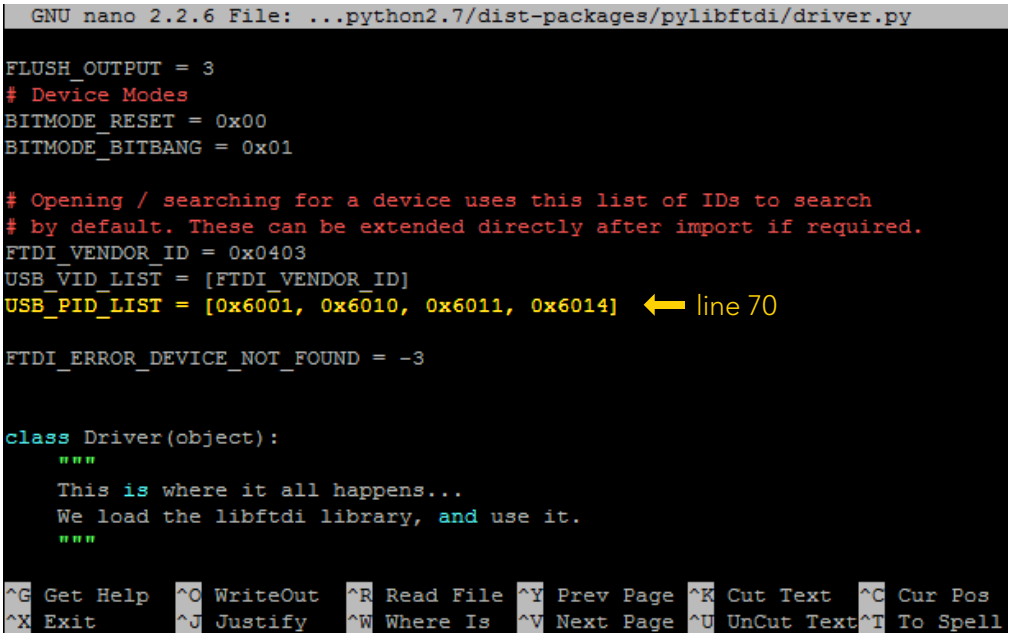
```
sudo service udev restart
```

Lastly, we need to modify the FTDI python driver.

Since Atlas Scientific™ FTDI devices use *USB PID (0x6015)*, we need to tweak the original FTDI driver, by entering the following command in terminal.

```
sudo nano /usr/local/lib/python2.7/dist-packages/pylibftdi/driver.py
```

Move down to the line 70 and add **0x6015** at the end of line.



Original line

USB_PID_LIST = [0x6001, 0x6010, 0x6011, 0x6014]

Modified line

```
USB_PID_LIST = [0x6001, 0x6010, 0x6011, 0x6014, 0x6015]
```

Press “CTRL+X”, then “Y” and hit Enter to save & exit.

Raspberry Pi sample code

Revised 2/15/17

Your Atlas Scientific™ EZO™ class circuits are almost ready to work with your Raspberry Pi, we just have to run a simple test first.

Connect your FTDI based USB device and run the following command in the terminal.

```
sudo python -m pylibftdi.examples.list_devices
```

The program will report information about each connected device.
You will get result like this:

```
FTDI:FT230X Basic UART:DA00TN6Q
```

Each FTDI adaptor has its own unique serial number.

In the result above, serial number is `DA00TN6Q`

Using pylibftdi module for Atlas Scientific™ EZO™ class circuits

Run the following commands in terminal.

```
cd ~/Raspberry-Pi-sample-code
```

```
sudo python ftdi.py
```

The program will present a list of available FTDI devies. Enter the index of the device you wish to use, and you will now be able to control an Atlas Scientific™ EZO™ class circuit via the USB port.

```
Discovered FTDI serial numbers:

Index:  0  Serial:  DA00OIQH

Index:  1  Serial:  DA00OJSH
==================================
Please select a device index:
```

For more details on the commands and responses, please refer to the datasheets of each Atlas Scientific™ EZO™ class circuit in use.

I²C Mode

I²C Mode

Before we can start using the Atlas Scientific™ EZO™ class circuits with your Raspberry Pi, we have to install and enable I²C bus on the Raspberry Pi.

Run the following commands in terminal.

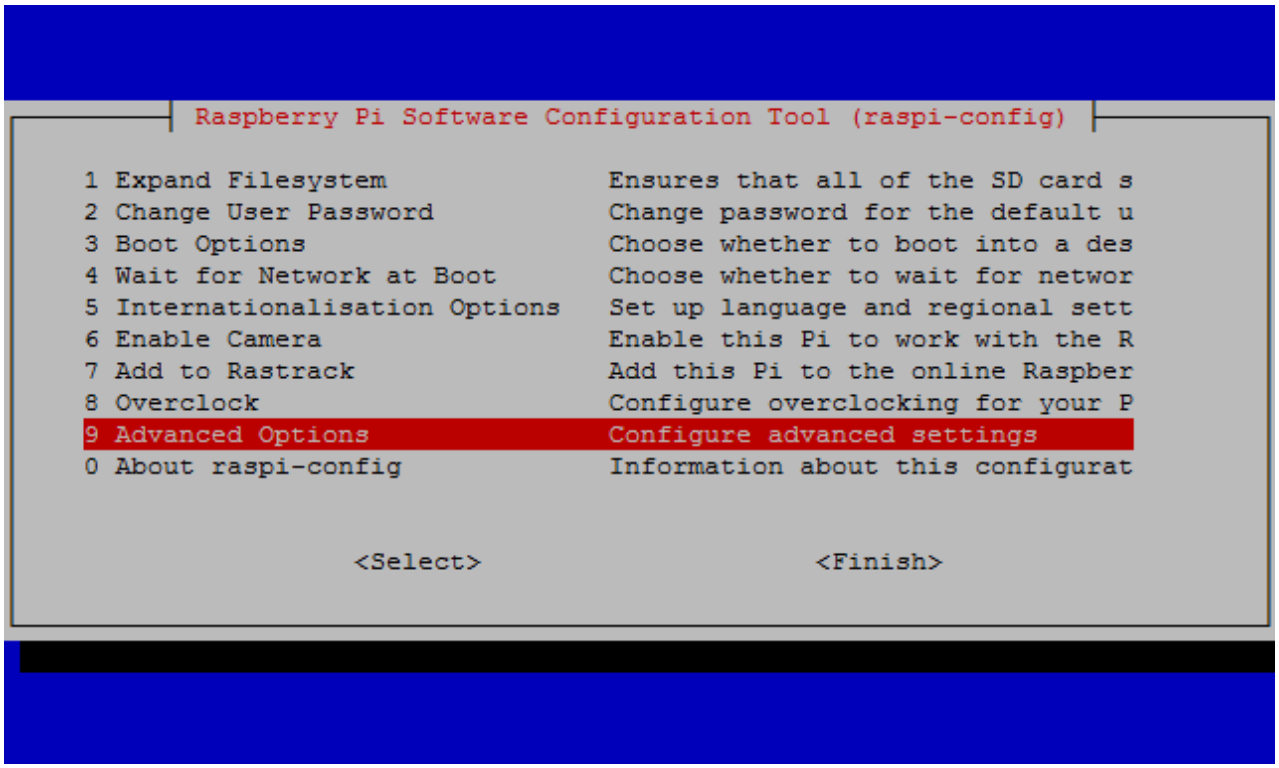
```
sudo apt-get install python-smbus
```

```
sudo apt-get install i2c-tools
```

Once those have finished installing, we need to head back to the Raspberry Pi config.

```
sudo raspi-config
```

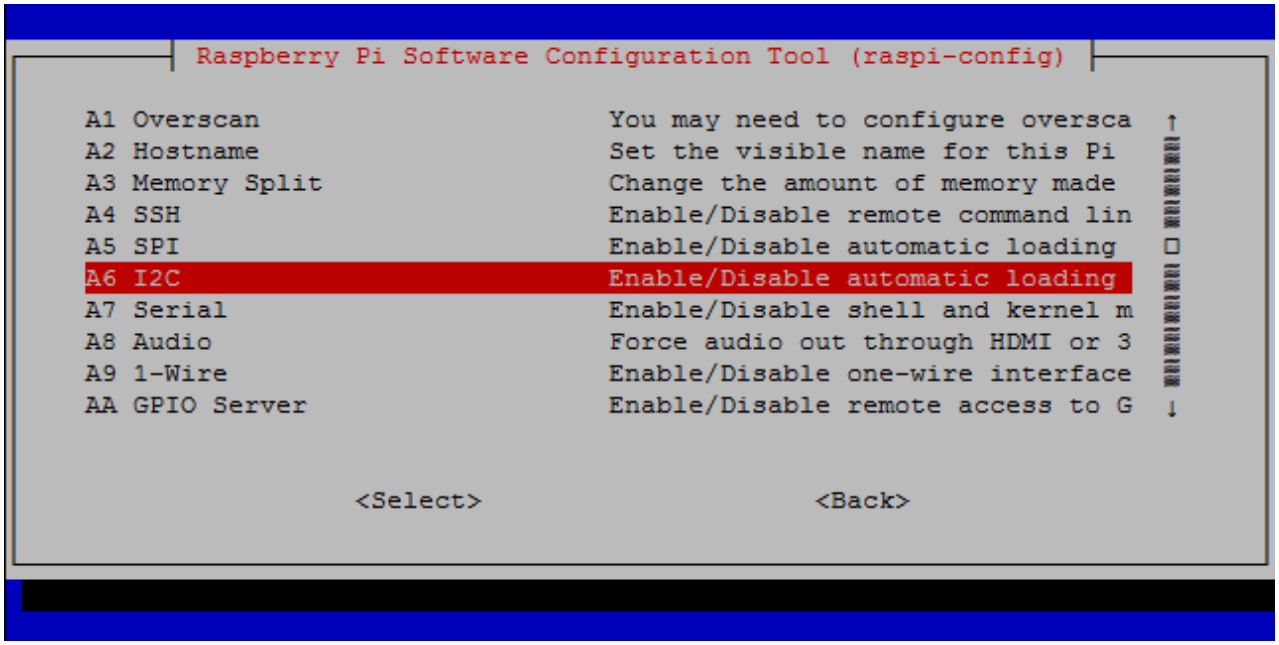
You should see a blue screen with options in a grey box in the center, like so



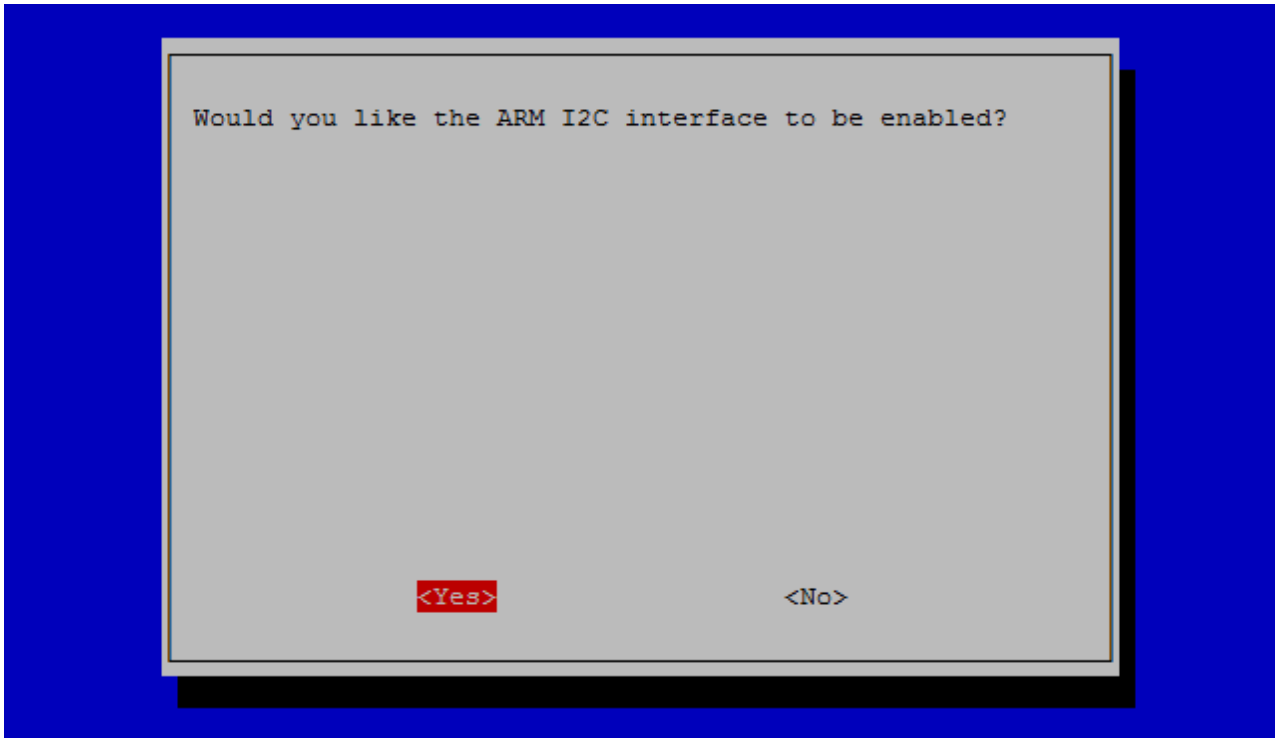
Choose “Advanced Options”

Raspberry Pi sample code

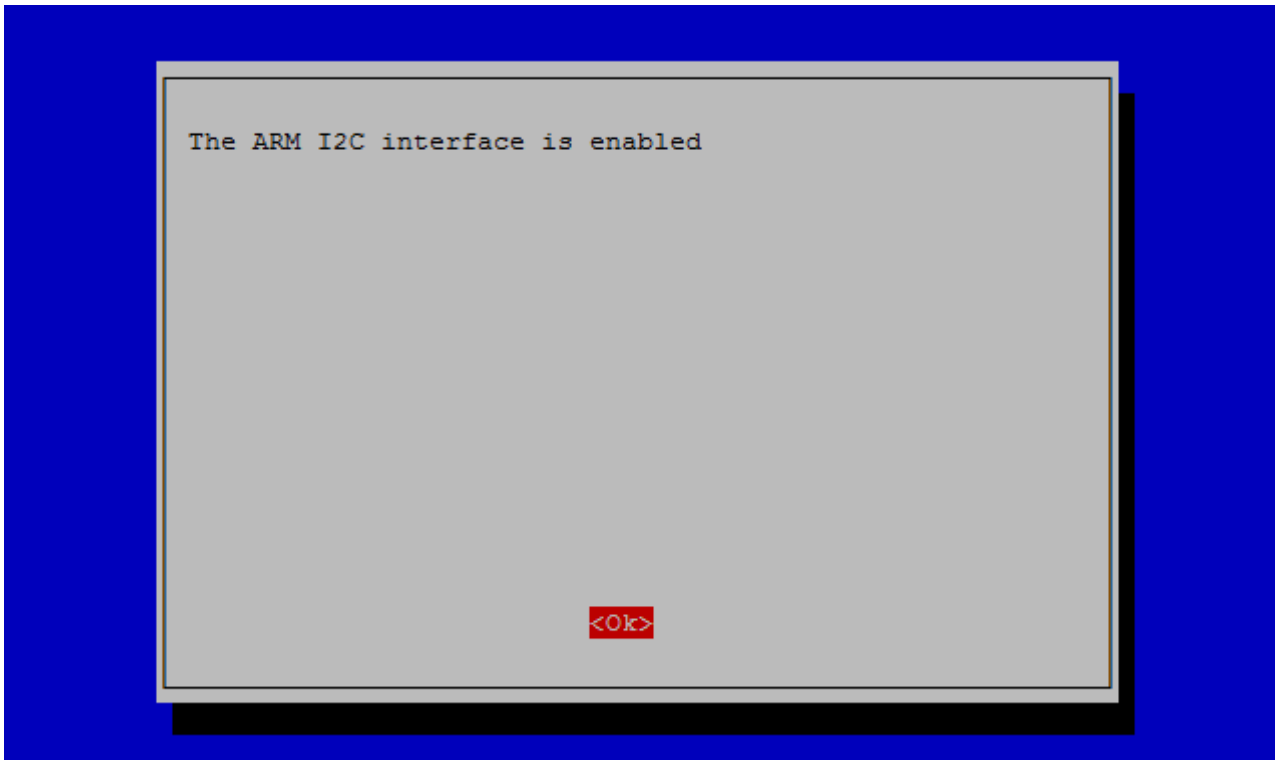
Revised 2/15/17



Choose “I2C”



Choose “YES”



Hit "OK" and reboot the Raspberry Pi.

```
sudo reboot
```

Raspberry Pi sample code

Revised 2/15/17

Your Atlas Scientific™ EZO™ class circuits are almost ready to work with your Raspberry Pi, we just have to run a simple test first.

Connect your EZO™ class circuit, and run the following command in terminal.

```
sudo i2cdetect -y 1
```

```
     0  1  2  3  4  5  6  7  8  9  a  b  c  d  e  f
00:          -- -- -- -- -- -- -- -- -- -- -- -- --
10: -- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
20: -- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
30: -- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
40: -- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
50: -- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
60: -- -- -- 63 -- -- -- -- -- -- -- -- -- -- -- --
70: -- -- -- -- -- -- -- --
```

The program will report information about each connected I²C device. This shows that an I²C address (0x63) is in use.

Run the following commands in terminal.

```
cd ~/Raspberry-Pi-sample-code
```

```
sudo python i2c.py
```

Each Atlas Scientific™ device has a different default I2C address.
To see a list of connected I²C devices from the program, use the command

```
List_addr
```

I2C address list	
pH	99
ORP	98
DO	97
EC	100
RTD	102

You can change the address using the command

```
ADDRESS,99
```

This will now change the I²C address to 99 (0x63)

For more details on the commands, responses and I²C addresses, please refer to the datasheets of each Atlas Scientific™ EZO™ class circuit in use.

UART Mode

UART Mode

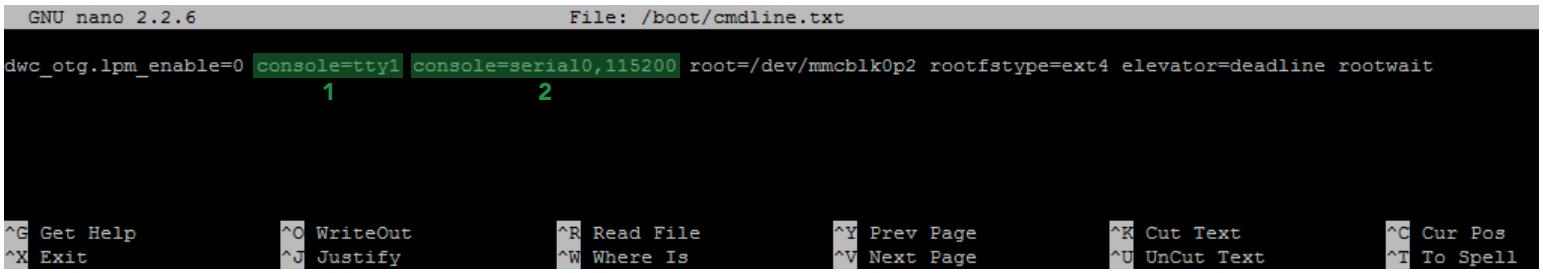
The Raspberry Pi Foundation has failed to make a working UART on the Pi 3. Because of this no UART connected devices can run on a Raspberry Pi 3 GPIO pins.

Before we can start using the Atlas Scientific™ EZO™ class circuits with your Raspberry Pi, we have to make a small tweak to the boot command line.

Run the following command line.

```
sudo nano /boot/cmdline.txt
```

You should see something that looks a lot like this:



You might see two seperate commands listed for the "console".

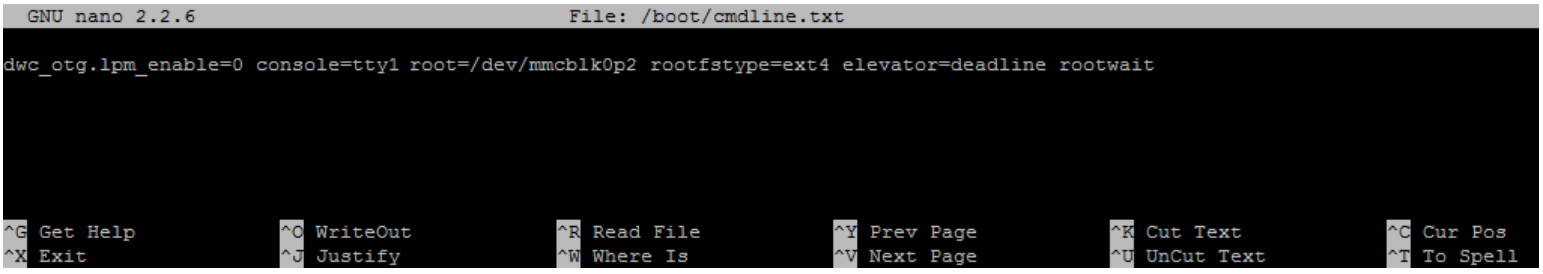
console=tty1 **console=serial0,115200**

1 2

This can cause a conflict in the serial port.

To correct this issue, ***delete*** the command:
console=serial0,115200

The command line should now look like this:



Press "CTRL+X", then "Y" and hit Enter to save & exit.

Raspberry Pi sample code

Revised 2/15/17

We need to ensure PySerial is installed for Python

```
sudo pip install pyserial
```

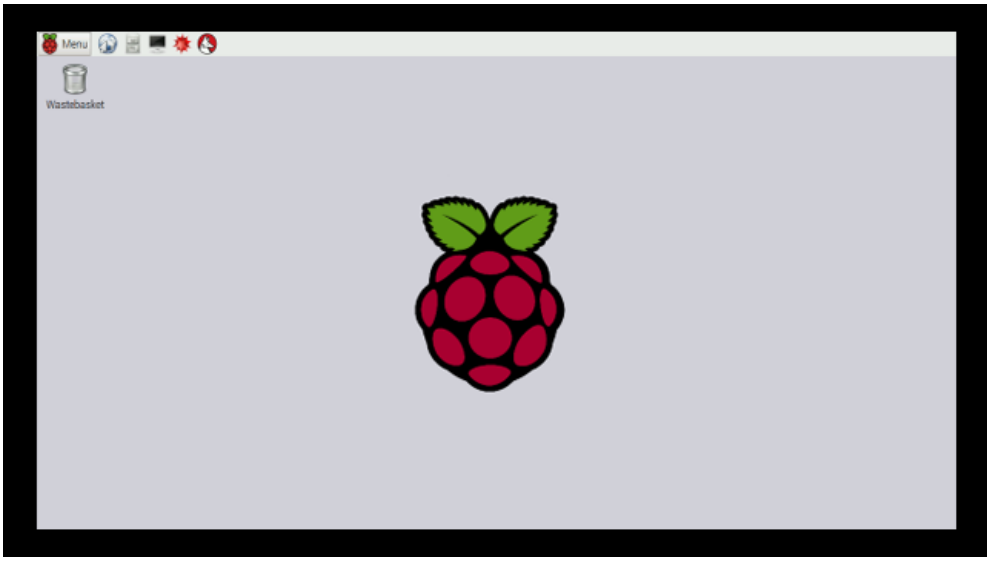
Run the following commands in terminal.

```
cd ~/Raspberry-Pi-sample-code
```

```
sudo python uart.py
```

Side note

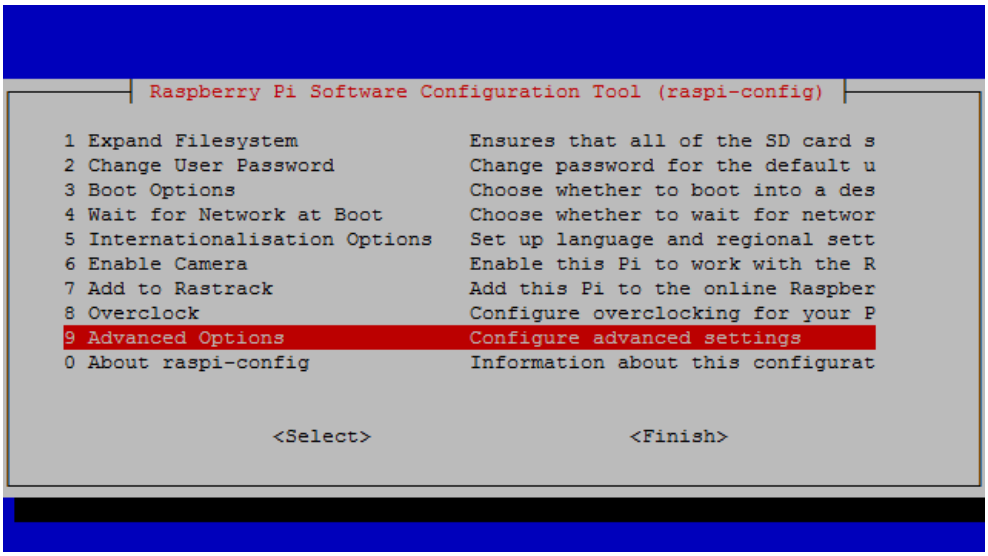
Does your Raspberry Pi have an annoying black border around the OS?



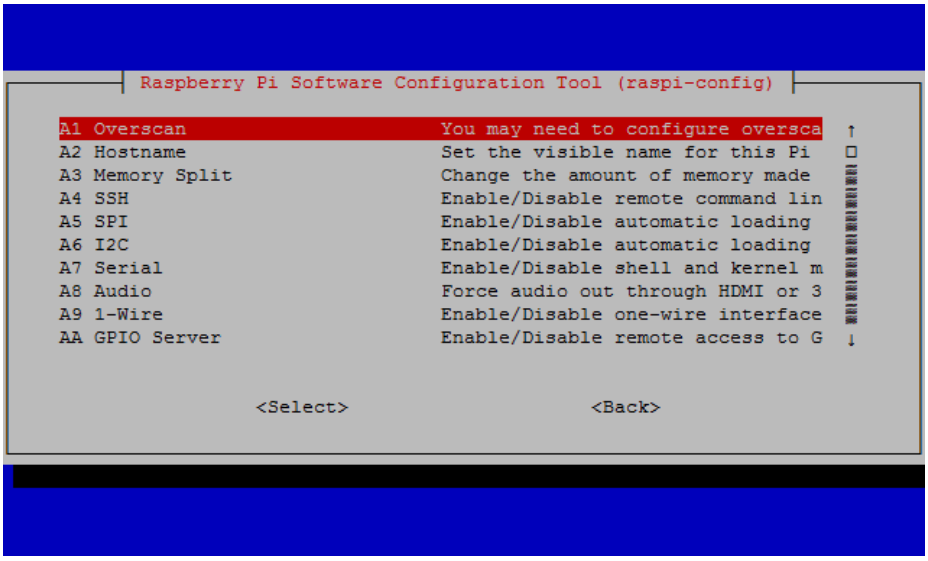
If so, here is how to remove it.

Run the following command line within the Raspberry Pi's terminal.

```
sudo raspi-config
```



Choose the option "Advanced Options"



Then, choose the option "A1 Overscan"

It will ask if you would like to enable compensation for displays with overscan?
say "**NO**"

The black border will know be gone. Enjoy!
